

Practical Exam Theory

Q.1.1 what is Data Analysis?
→ Data Analysis is the process of Collecting, cleaning and examining data to find useful information.

Q.2.1 what are the steps in a Data Science project?
→ The main steps are problem definition, data collection, data understanding, data cleaning, EDA, feature engineering, model building, evaluation and deployment. These steps help solve a data problem systematically.

Q.3.1 How to frame this Dataset as a Machine Learning problem (Binary Classification)?
→ Dataset can be framed as a binary classification problem when the target has two possible classes, such as 0 and 1.

Q.4.1 what is XLOOKUP?
→ XLOOKUP is an Excel function used to search for a value in one range and return the related value from another range. In this practical, it can be used with 'Team id' to get the department.

Q.5.1 what is a breach flag?
→ A breach flag is a derived field used to identify whether a ticket has exceeded the SLA limit. Here 'breach flag' when resolution time by department and month.

Q.6.1 what is a pivotTable?
→ A pivotTable is an Excel feature used to summarize and analyze data. It can show average resolution time by department and month.

Q.14 What is a Join in SQL?

→ A Join is used to Combine related data from two or more tables using a Common Column. In this practical, 'team-id' connects the tickets table with the teams table.
